

Mina Lotfy Saad

.NET Backend Developer

Alexandria, Egypt | +20 1208040804 | minalotfysaad@gmail.com | [linkedin.com/in/minalotfysaad](https://www.linkedin.com/in/minalotfysaad) | github.com/Minalotfysaad | minalotfysaad.github.io/Portfolio

PROFESSIONAL SUMMARY

.NET Backend Developer with hands-on experience building secure and scalable RESTful APIs using ASP.NET Core, C#, Entity Framework Core, and SQL Server. Experienced in developing production-style backend systems with Clean Architecture, SOLID principles, and modern design patterns. Built multiple backend applications featuring authentication, role-based authorization, caching, validation, and scalable database design, with a strong focus on clean code, maintainability, and performance.

PROFESSIONAL EXPERIENCE

.NET Backend Developer | *Vetanoia Solutions* / Alexandria, Egypt | November 2025 – June 2026

- Developed and enhanced RESTful API endpoints using ASP.NET Core Web API to support business workflows and client-facing features.
- Designed and optimized database queries using Entity Framework Core and SQL Server to improve application performance.
- Implemented JWT authentication and ASP.NET Identity to secure API endpoints and enforce role-based access control.
- Contributed to backend development following Clean Architecture and SOLID principles while collaborating with senior developers using Git and GitHub.
- Documented and tested APIs using Swagger to streamline frontend integration and team collaboration.

TECHNICAL SKILLS

Languages: C#, SQL, JavaScript, TypeScript

Backend Frameworks: ASP.NET Core Web API, .NET, REST APIs

Security: ASP.NET Identity, JWT Authentication, Role-Based Authorization

Architecture & Design: Clean Architecture, Repository Pattern, Unit of Work, Dependency Injection, Specification Pattern, SOLID Principles

Databases: SQL Server, Redis

Libraries: AutoMapper, FluentValidation, Entity Framework Core, LINQ

Tools: Git, GitHub, Visual Studio, Postman, Docker, GitHub Actions, Swagger, xUnit, Moq

AI-Assisted Development: Claude, Google Antigravity, AI Agents for code analysis, backend debugging, workflow acceleration, and rapid frontend prototyping

FEATURED PROJECTS

Employee Leave Management System | [GitHub Repository](#)

Technologies: ASP.NET Core 9 • C# • Entity Framework Core • SQL Server • ASP.NET Identity • JWT Authentication • Refresh Tokens • Clean Architecture • Repository Pattern • Unit of Work • Dependency Injection • AutoMapper • FluentValidation • Swagger • Git • Docker • Redis • Serilog • xUnit • Moq • GitHub Actions

- Designed and developed a production-style HR management backend supporting leave requests, department management, and role-based workflows.
- Implemented JWT authentication, Refresh Tokens, and ASP.NET Identity to secure Employee, Manager, and HR endpoints.
- Built Repository and Unit of Work patterns with Entity Framework Core to create a maintainable and testable data access layer.
- Enforced request validation using FluentValidation and integrated AutoMapper to simplify DTO-to-entity mapping.
- Developed RESTful APIs supporting pagination, filtering, search, centralized exception handling, structured logging, and Swagger documentation.

E-Commerce API | [GitHub Repository](#)

Technologies: ASP.NET Core • C# • Entity Framework Core • SQL Server • Redis • Stripe API • ASP.NET Identity • JWT Authentication • Clean Architecture • Repository Pattern • Unit of Work • Specification Pattern • Dependency Injection • AutoMapper • Swagger • Git

- Designed and developed a scalable e-commerce backend supporting product management, shopping baskets, secure order processing, and online payments.
- Integrated Stripe Payment Gateway and JWT authentication to provide secure checkout and user authorization.
- Improved application performance and reduced database load by implementing Redis caching for frequently accessed catalog data.
- Optimized complex product filtering, sorting, and pagination using the Specification Pattern with Repository and Unit of Work.
- Designed modular backend services following Clean Architecture to improve maintainability and scalability.

CompetitionsHub API | [GitHub Repository](#)

Technologies: ASP.NET Core • C# • Entity Framework Core • SQL Server • ASP.NET Identity • JWT Authentication • Clean Architecture • Repository Pattern • Unit of Work • Dependency Injection • AutoMapper • FluentValidation • Swagger • Git

- Developed a backend platform for managing competitions, competition days, contestants, and question lifecycles.
- Implemented role-based workflows supporting administrators, judges, and contestants through secure RESTful APIs.
- Automated competition evaluation by supporting manual grading, automatic scoring, leaderboard generation, and result publishing.
- Applied Clean Architecture with Repository and Unit of Work patterns to build a modular and maintainable backend.
- Designed a normalized SQL Server database using Entity Framework Core to manage competitions, grading records, and rankings.

EDUCATION

Web Development Diploma (.NET Full Stack) | **Route IT Training Center** | 2024 – 2025

Bachelor of Engineering | **Faculty of Engineering, Alexandria University** | 2018 – 2025

LANGUAGES

Arabic — Native

English — Professional Working Proficiency

German — Intermediate

ADDITIONAL INFORMATION

Military Status: Exempted from Military Service

Availability: Available for Full-Time Opportunities

Willing to Relocate: Yes
